

How population movement affects the spread of COVID-19 in Poland

Commuting to work

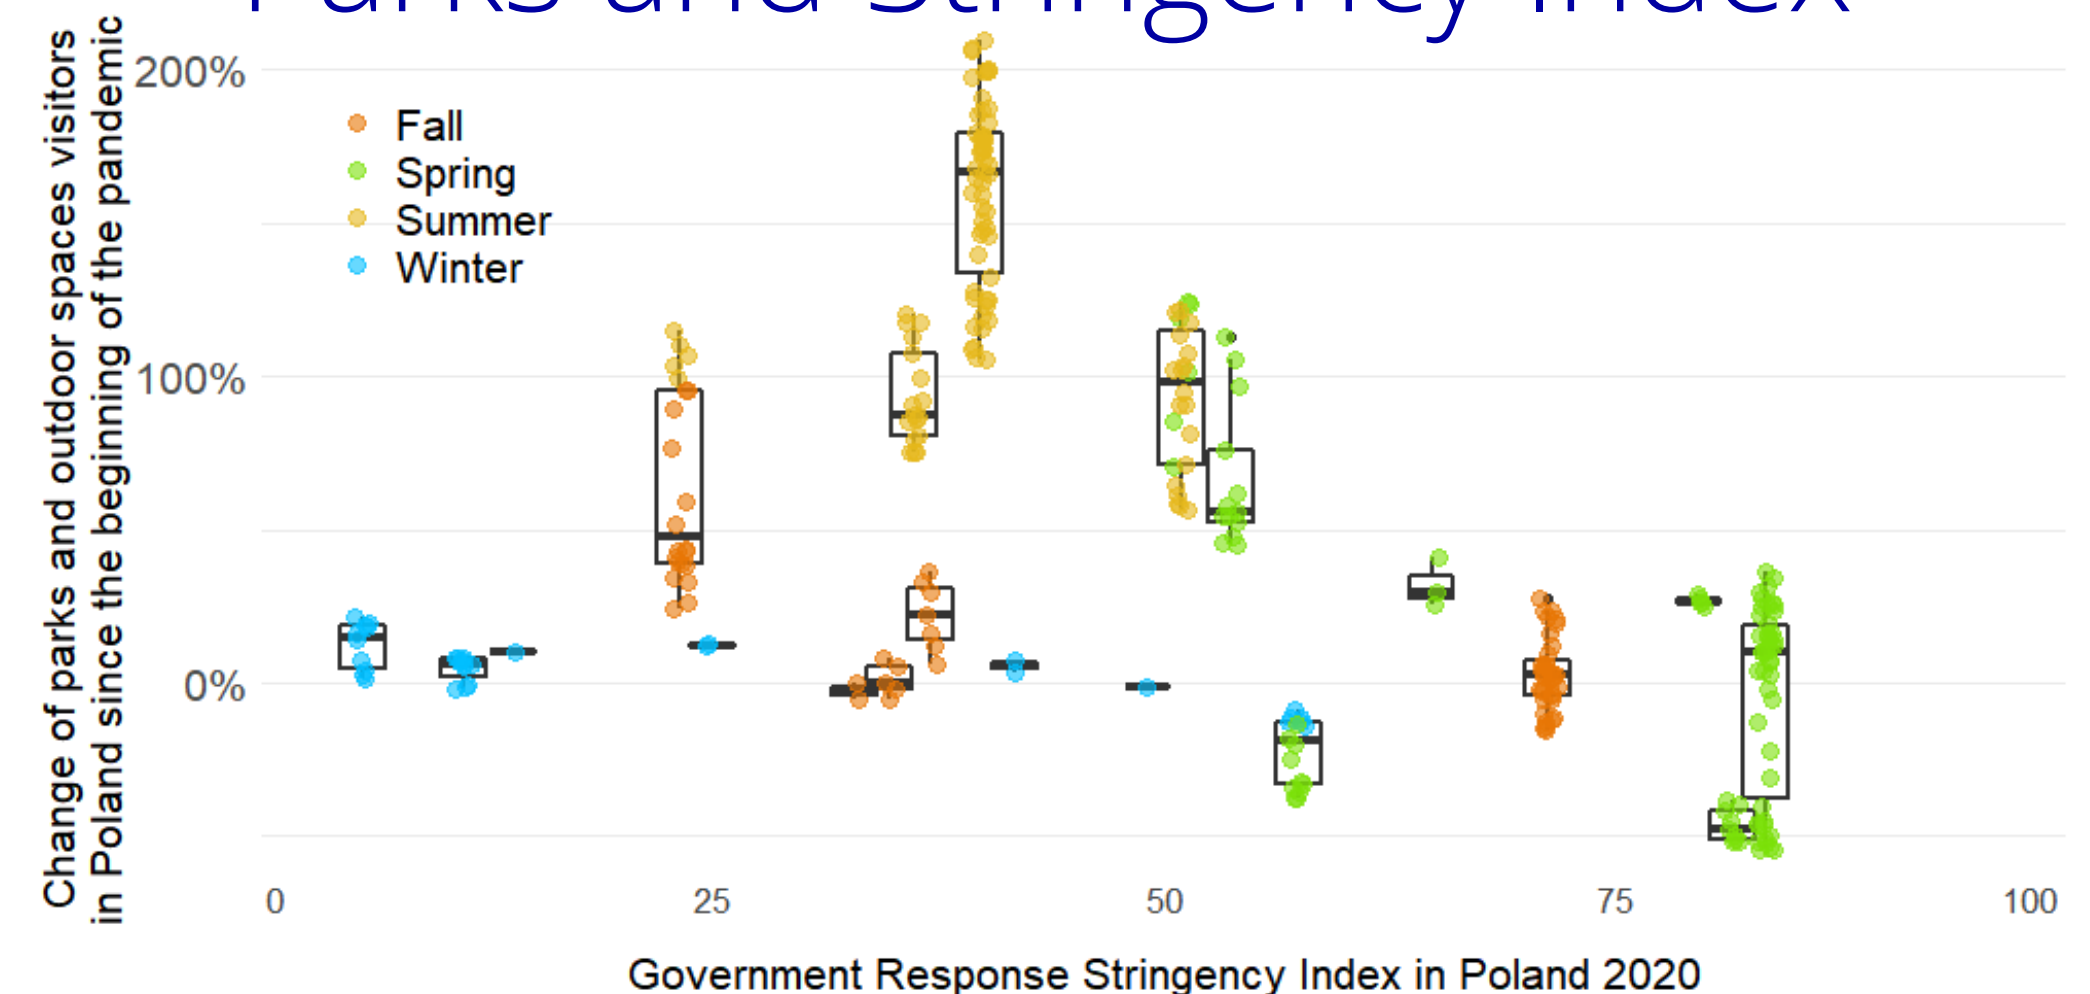

The map illustrates the total amount of infected people in the Mazowieckie Voivodeship (01.11.2020) with a division into municipalities. Black lines indicate the number of people commuting to work. Although presented data come from the year 2016, we believe the proportions are still preserved.

Tourism and Covid

The graph shows the decrease of tourism (that is number of accommodations) in the year 2020 in comparison to the mean values from years 2015-2019. This data is presented in the context with the numbers of confirmed cases from the past two weeks.

Parks and Stringency Index

Government Response Stringency Index (GRSI) is a measurement based on indicators such as school closures, workplace closures, travel bans, etc. rescaled to a value from 0 to 100 (100 = strictest). This graph shows how number of visitors of parks and outdoor spaces has changed since the beginning of pandemic in comparison to the GRSI at that time.
